

Invevo Feature

Blended Credit Risk Report

See external credit risk and actual payment behaviour together

The Blended Credit Risk Report combines updated Creditsafe information with the payment behaviour held in Invevo, giving credit teams a more complete view of each customer.

Instead of assessing external credit data and internal trading experience separately, teams can review both within one configurable dashboard.

Understand the risk behind the score

An external credit score is important, but it does not show the complete relationship.

A customer may have a strong external profile while consistently paying your organisation late. Another may have a more cautious credit profile but demonstrate dependable payment behaviour with you.

The Blended Credit Risk Report puts both perspectives together.

Blended Credit Risk Report

What it enables

- Request updated Creditsafe information directly from a customer account.
- Feed that information into the Invevo credit risk dashboard.
- Combine external credit data with internal payment behaviour.
- Configure the blend around your data and customer base.
- Ask an AI assistant to assess the available information.
- Generate summaries, suggested actions and risk observations.

Why it matters

Credit decisions become more relevant when they reflect both market intelligence and the customer's actual relationship with your business.

The report gives credit teams a shared view from which to investigate risk, review exposure and determine the appropriate next action.

Ask better credit questions

The embedded AI assistant can help users explore the blended report by prompting it to:

- Summarise the customer's credit position.
- Assess their recent payment behaviour.
- Identify relevant areas for investigation.
- Suggest potential next actions.
- Produce a concise account summary.

Bring credit data and payment behaviour together
